# FieldBook Software

FieldBook Software, from RST Instruments Ltd., is designed to be used as an intuitive electronic fieldbook to record manual readings in the field. It permits operators to quickly enter new records into existing data files on RST's Ultra-Rugged Field PC<sup>2</sup> in an easy to use format.

The Field PC<sup>2</sup> is a touch-screen handheld device that easily transports from site-to-site and is extremely durable in harsh elements. The large data entry buttons in the FieldBook Software are ideally suited for the Field PC<sup>2</sup>'s touch-screen without the need for a stylus. Files are stored in a common CSV format for easy import into data display programs such as Microsoft Excel™ or RST Instruments Geoviewer. Data file templates can be set up on a PC and transferred to the Field PC<sup>2</sup> via ActiveSync™ connection. After collecting data in the field, data files can be transferred from Field PC<sup>2</sup> to office desktop PC for quick analysis.

Water level readings being manually entered into FieldBook at a project site.
